Summary of Alerts

Risk Level	Number of Alerts
High	5
Medium	3
Low	5
Informational	7

Alerts

Name	Risk Level	Number of Instances
SQL Injection	High	60
SQL Injection - Hypersonic SQL - Time Based	High	1
SQL Injection - Oracle - Time Based	High	2
SQL Injection - PostgreSQL - Time Based	High	2
SQL Injection - SQLite	High	1
Absence of Anti-CSRF Tokens	Medium	142
Content Security Policy (CSP) Header Not Set	Medium	102
Vulnerable JS Library	Medium	6
Big Redirect Detected (Potential Sensitive Information Leak)	Low	1
Cookie No HttpOnly Flag	Low	39
Cookie without SameSite Attribute	Low	42
Timestamp Disclosure - Unix	Low	168
X-Content-Type-Options Header Missing	Low	1
Authentication Request Identified	Informational	15
Cookie Poisoning	Informational	39
Information Disclosure - Suspicious Comments	Informational	174
Modern Web Application	Informational	58
Session Management Response Identified	Informational	6
User Agent Fuzzer	Informational	2677
User Controllable HTML Element Attribute (Potential XSS)	Informational	39

Alert Detail

High	SQL Injection
Description	SQL injection may be possible.
URL	http://172.16.2.86/SOGo/%25255C%252522http:/gnu.org/licenses/%255C%2522http:/gnu.org/licenses/%5C%22http:/gnu.org/licenses/gpl.html%5C%22
Method	POST
Attack	ZAP' AND '1'='1' --
Evidence	
Other Info	The page results were successfully manipulated using the boolean conditions [ZAP' AND '1'='1' --] and [ZAP' AND '1'='2' --] The parameter value being modified was stripped from the HTML output for the purposes of the comparison Data was returned for the original parameter. The vulnerability was detected by successfully restricting the data originally returned, by manipulating the parameter
URL	http://172.16.2.86/SOGo/%25255C%252522http:/gnu.org/licenses/%255C%2522http:/gnu.org/licenses/%5C%22http:/gnu.org/licenses/gpl.html%5C%22
Method	POST
Attack	ZAP AND 1=1 --
Evidence	
Other Info	The page results were successfully manipulated using the boolean conditions [ZAP AND 1=1 --] and [ZAP AND 1=2 --] The parameter value being modified was stripped from the HTML output for the purposes of the comparison Data was returned for the original parameter. The vulnerability was detected by successfully restricting the data originally returned, by manipulating the parameter

Solution	Do not trust client side input, even if there is client side validation in place. In general, type check all data on the server side. If the application uses JDBC, use PreparedStatement or CallableStatement, with parameters passed by '?' If the application uses ASP, use ADO Command Objects with strong type checking and parameterized queries. If database Stored Procedures can be used, use them. Do *not* concatenate strings into queries in the stored procedure, or use 'exec', 'exec immediate', or equivalent functionality! Do not create dynamic SQL queries using simple string concatenation. Escape all data received from the client. Apply an 'allow list' of allowed characters, or a 'deny list' of disallowed characters in user input. Apply the principle of least privilege by using the least privileged database user possible. In particular, avoid using the 'sa' or 'db-owner' database users. This does not eliminate SQL injection, but minimizes its impact. Grant the minimum database access that is necessary for the application.

Medium	Absence of Anti-CSRF Tokens
	No Anti-CSRF tokens were found in a HTML submission form. A cross-site request forgery is an attack that involves forcing a victim to send an HTTP request to a target destination without their knowledge or intent in order to perform an action as the victim. The underlying cause is application functionality using predictable URL/form actions in a repeatable way. The nature of the attack is that CSRF exploits the trust that a web site has for a user. By contrast, cross-site scripting (XSS) exploits the trust that a user has for a web site. Like XSS, CSRF attacks are not necessarily cross-site, but they can be. Cross-site request forgery is also known as CSRF, XSRF, one-click attack, session riding, confused deputy, and sea surf. CSRF attacks are effective in a number of situations, including:

Description	
	* The victim has an active session on the target site.
	* The victim is authenticated via HTTP auth on the target site.
	* The victim is on the same local network as the target site.
	CSRF has primarily been used to perform an action against a target site using the victim's privileges, but recent techniques have been discovered to disclose information by gaining access to the response. The risk of information disclosure is dramatically increased when the target site is vulnerable to XSS, because XSS can be used as a platform for CSRF, allowing the attack to operate within the bounds of the same-origin policy.

Instances	142	
	Phase: Architecture and Design Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid.	

Solution	For example, use anti-CSRF packages such as the OWASP CSRFGuard.
	Phase: Implementation
	Ensure that your application is free of cross-site scripting issues, because most CSRF defenses can be bypassed using attacker-controlled script.
	Phase: Architecture and Design
	Generate a unique nonce for each form, place the nonce into the form, and verify the nonce upon receipt of the form. Be sure that the nonce is not predictable (CWE-330).
	Note that this can be bypassed using XSS.
	Identify especially dangerous operations. When the user performs a dangerous operation, send a separate confirmation request to ensure that the user intended to perform that operation.
	Note that this can be bypassed using XSS.
	Use the ESAPI Session Management control.
	This control includes a component for CSRF.
	Do not use the GET method for any request that triggers a state change.
	Phase: Implementation
	Check the HTTP Referer header to see if the request originated from an expected page. This could break legitimate functionality, because users or proxies may have disabled sending the Referer for privacy reasons.
Reference	http://projects.webappsec.org/Cross-Site-Request-Forgery https://cwe.mitre.org/data/definitions/352.html
CWE Id	352
WASC Id	9
Plugin Id	10202

Medium	Content Security Policy (CSP) Header Not Set
Description	Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks. These attacks are used for everything from data theft to site defacement or distribution of malware. CSP provides a set of standard HTTP headers that allow website owners to declare approved sources of content that browsers should be allowed to load on that page — covered types are JavaScript, CSS, HTML frames, fonts, images and embeddable objects such as Java applets, ActiveX, audio and video files.

Plugin Id	10003

Low	Big Redirect Detected (Potential Sensitive Information Leak)
Description	The server has responded with a redirect that seems to provide a large response. This may indicate that although the server sent a redirect it also responded with body content (which may include sensitive details, PII, etc.).
URL	http://172.16.2.86/
Method	POST
Attack	
Evidence	
Other Info	Location header URI length: 1 [/]. Predicted response size: 301. Response Body Length: 25,884.
Instances	1
Solution	Ensure that no sensitive information is leaked via redirect responses. Redirect responses should have almost no content.

CWE Id	201
WASC Id	13
Plugin Id	10044

Low	Cookie No HttpOnly Flag
Description	A cookie has been set without the HttpOnly flag, which means that the cookie can be accessed by JavaScript. If a malicious script can be run on this page then the cookie will be accessible and can be transmitted to another site. If this is a session cookie then session hijacking may be possible.

Low	Cookie without SameSite Attribute

Description	A cookie has been set without the SameSite attribute, which means that the cookie can be sent as a result of a 'cross-site' request. The SameSite attribute is an effective counter measure to cross-site request forgery, cross-site script inclusion, and timing attacks.

Low	X-Content-Type-Options Header Missing

Description	The Anti-MIME-Sniffing header X-Content-Type-Options was not set to 'nosniff'. This allows older versions of Internet Explorer and Chrome to perform MIME-sniffing on the response body, potentially causing the response body to be interpreted and displayed as a content type other than the declared content type. Current (early 2014) and legacy versions of Firefox will use the declared content type (if one is set), rather than performing MIME-sniffing.
URL	http://172.16.2.86/img/cow_mailcow.svg
Method	GET
Attack	
Evidence	
Other Info	This issue still applies to error type pages (401, 403, 500, etc.) as those pages are often still affected by injection issues, in which case there is still concern for browsers sniffing pages away from their actual content type. At "High" threshold this scan rule will not alert on client or server error responses.
Instances	1
Solution	Ensure that the application/web server sets the Content-Type header appropriately, and that it sets the X-Content-Type-Options header to 'nosniff' for all web pages. If possible, ensure that the end user uses a standards-compliant and modern web browser that does not perform MIME-sniffing at all, or that can be directed by the web application /web server to not perform MIME-sniffing.

Informational	Authentication Request Identified
Description	The given request has been identified as an authentication request. The 'Other Info' field contains a set of key=value lines which identify any relevant fields. If the request is in a context which has an Authentication Method set to "Auto-Detect" then this rule will change the authentication to match the request identified.

Informational	Cookie Poisoning
Description	This check looks at user-supplied input in query string parameters and POST data to identify where cookie parameters might be controlled. This is called a cookie poisoning attack, and becomes exploitable when an attacker can manipulate the cookie in various ways. In some cases this will not be exploitable, however, allowing URL parameters to set cookie values is generally considered a bug.
URL	http://172.16.2.86/?lang=cs-cz
Method	GET
Attack	
Evidence	

Other Info	An attacker may be able to poison cookie values through URL parameters. Try injecting a semicolon to see if you can add cookie values (e.g. name=controlledValue; name=anotherValue;). This was identified at: http://172.16.2.86/?lang=cs-cz User-input was found in the following cookie: mailcow_locale=cs-cz; expires=Mon, 25 Nov 2024 10:24:29 GMT; Max-Age=30758400 The user input was: lang=cs-cz	
URL	http://172.16.2.86/?lang=da-dk	
Method	GET

URL		http://172.16.2.86/?lang=uk-ua
	Method	POST
	Attack	

Evidence	
Other Info	An attacker may be able to poison cookie values through POST parameters. To test if this is a more serious issue, you should try resending that request as a GET, with the POST parameter included as a query string parameter. For example: http://nottrusted.com/page?value=maliciousInput. This was identified at: http://172.16.2.86/?lang=uk-ua User-input was found in the following cookie: mailcow_locale=uk-ua; expires=Mon, 25 Nov 2024 10:26:20 GMT; Max-Age=30758400 The user input was: lang=uk-ua
Instances	39
Solution	Do not allow user input to control cookie names and values. If some query string parameters must be set in cookie values, be sure to filter out semicolon's that can serve as name/value pair delimiters.

Informational	Session Management Response Identified
Description	The given response has been identified as containing a session management token. The 'Other Info' field contains a set of header tokens that can be used in the Header Based Session Management Method. If the request is in a context which has a Session Management Method set to "Auto-Detect" then this rule will change the session management to use the tokens identified.

Informational	User Controllable HTML Element Attribute (Potential XSS)

Description	This check looks at user-supplied input in query string parameters and POST data to identify where certain HTML attribute values might be controlled. This provides hot-spot detection for XSS (cross-site scripting) that will require further review by a security analyst to determine exploitability.
URL	http://172.16.2.86/?lang=cs-cz
Method	GET
Attack	
Evidence	
Other Info	User-controlled HTML attribute values were found. Try injecting special characters to see if XSS might be possible. The page at the following URL: http://172.16.2.86/?lang=cs-cz appears to include user input in: a(n) [html] tag [lang] attribute The user input found was: lang=cs-cz The user-controlled value was: cs-cz
URL	http://172.16.2.86/?lang=da-dk
Method	GET
Attack	
Evidence	
Other Info	User-controlled HTML attribute values were found. Try injecting special characters to see if XSS might be possible. The page at the following URL: http://172.16.2.86/?lang=da-dk appears to include user input in: a(n) [html] tag [lang] attribute The user input found was: lang=da-dk The user-controlled value was: da-dk
URL	http://172.16.2.86/?lang=de-de
